

CYTOTOXICITY: WHAT KILLS HEALING

CYTOTOXIC:
Toxic to living cells.

FIBROBLASTS & KERATINOCYTES:
The master repair cells responsible for closing your wound.

THE CULPRITS

ISOPROPYL ALCOHOL

HYDROGEN PEROXIDE

UNDILUTED ESSENTIAL OILS
(E.G., TEA TREE)

These agents do not just kill bacteria; they kill your own repair cells, immediately delaying wound healing and stripping pigment. If it is not formulated for wound care, it does not belong on a fresh tattoo or piercing.
